

Curb Ramp™ Installation Instructions

Step 1: Do a “Dry-Run”

Before priming the curb surface and mixing the material with the adhesive, we strongly recommend that you spread the dry material to fill your driveway curb gap to ensure you have ordered enough. If it covers the desired area, simply sweep the material back into the container and proceed with priming and mixing.

Step 2a: **This step is only required for removable-substrate ramps.*

For easily removable custom-fit curb ramps, first lay down a protective substrate over the curb surface so you don't prime the curb surface directly. Tape down the edges of the substrate. We recommend using a durable rubber membrane (e.g. shower pan liner, rubber roofing membrane, pond liner). Substrates can also be purchased on our website. Next, prime the substrate to ensure good material bond.

Step 2b: **Only for ramps bonded to the curb.*

Sweep and blow the area to remove all dirt and help the primer adhere to the curb surface. Pressure washing may be necessary for badly soiled curbs.

Step 3. Prime

Prime the area using approximately ¼ gallon (or less) of the enclosed adhesive. To ensure you preserve enough adhesive for the compound, mix the adhesive with the material first and use what's left over to prime.

Caution: The adhesive is very strong and does not come off easily so we recommend wearing disposable gloves. Exercise caution to avoid leakage over unwanted areas and avoid contact with skin. If regular hand soap fails to remove from skin, a heavy-duty hand cleaner like GOJO can be used.

Step 4: Mix & Spread

- a) Mix the material with the remaining adhesive (about ¾ gallon) using a trowel until the granules are fully coated. You can use the shipping box or an empty 5 gallon bucket for mixing. The granules should be wet and fully coated, but the mix should not be too soupy.
- b) Spread the mixture to fill the curb at the desired angle to bridge the gap between the driveway and the street. Slope feather out the edges to facilitate water drainage. Compress and shape the edges using a trowel to get clean install lines.

Step 5: Topcoat (Optional)

The adhesive used for the ramp makes an excellent topcoat. If you have leftover adhesive, wait until the ramp has dried before applying. We also sell individual cans of adhesive on our website. When applying a topcoat, we recommend pouring the adhesive into a paint tray and using a paint roller.

Note: If you would like to match the color of the ramp to the curb, you can apply a powdered cement from a local hardware store as a topcoat. Just sprinkle the concrete dust over the ramp to achieve the desired look. You can apply the powder while the ramp is still drying, or at a later time, provided you apply a layer of adhesive first.
